

### **COST ESTIMATING METHODOLOGY:**

### **Transportation Capacity Projects**

For the 2040 Plan, capacity projects were defined as widening or extending major roads, or building new fixed-guideway transit systems. Under federal regulations, these types of projects must be itemized in the Plan, rather than being grouped into programmatic categories. To better focus limited resources on economic vitality and severe congestion, the MPO's list of capacity needs was screened by level of congestion and by proximity to employment centers. Cost estimates have been prepared for capacity projects that serve clusters of 5,000 or more jobs and that improve a major road with 2040 traffic volumes that are 30% or more over capacity.

Some capacity projects have been previously studied, and detailed cost estimates have been prepared; in such cases, those estimates were used. For all other roadway projects, roadway cost estimates were calculated using the Florida Department of Transportation's (FDOT) average unit costs per centerline mile (Cost Per Mile Models) by facility and improvement type. These unit costs originated from the FDOT Long Range Estimating System or from the Cost Per Centerline Mile estimates use by FDOT District 7. All roadway widening projects were assumed to have the same associated cost as new construction roadway projects with the same number of lanes and capacity. Cost estimates include contingencies for construction mobilization, maintenance of traffic during construction (MOT), project unknowns (scope), long range planning, design, and construction management (CEI). Contingencies assumed for all roadway projects are as follows:

A. MOT 10% of cost per centerline mile B. Mobilization 10% of (cost per centerline mile + A) C. **Construction Subtotal** Cost per centerline mile +A + B 25% of construction subtotal D. Scope Contingency E. CEI 15 % of(construction subtotal +D) F. Long Range Planning 25% of construction subtotal G. Total Construction Cost construction subtotal + D+E+F H. Design 15% of total construction

The following tables identify the cost per centerline mile assumptions for each project and the details used in developing the cost estimates for the capacity projects included in the 2040 Transportation Plan.

### **RIGHT-OF-WAY COSTS**

Cost estimates for new facilities and widening of existing facilities took into consideration the potential of the acquisition of additional right-of-way (ROW). Taking the projects geographic location (inside or outside the Urban Service Area) and facility type into account, ROW cost factors were applied as described below:

LRTP Needs Assessment: Major Project Cost Estimates

November 2014

Final Document

Page 1

- "High" (H) cost assumes that the ROW will cost 100 percent of the total construction cost
- "Medium" (M) cost assumes that the ROW will cost 50 percent of the total construction cost
- "Low" (L) cost assumes that the ROW will cost 25 percent of the total construction cost

### **SOURCES**

The following is a list of resources for projects included in the 2040 Needs:

### **Roadway Projects:**

- FDOT Cost Per Centerline Mile Models (June 2012); Specific to FDOT District 7
- FDOT Long Range Estimating (LRE) System for current/on-going projects
- Tampa Bay Express project cost estimates (March 2014)

### Other Project Types:

- Transit Assets & Opportunities Study, Hillsborough MPO (2014)
- FTA Section 5307 grant application for water transit, HART (2014)
- Tampa International Airport Master Plan, Appendix L, Airport Automated People Mover Extension (2013)
- Multimodal Center based on Durham Station Multimodal in Durham, NC (2009)
- Parking garage and pedestrian overpass construction base on Pinellas Alternatives Analysis (2013)

<sup>(1)</sup> Cost Per Mile obtained from FDOT LRE System - 2013 Price Update

<sup>(2)</sup> Cost Per Mile obtained from FDOT District 7 (June 2012)

<sup>(3)</sup> Cost Per Mile estimated by combining incremental improvements (ie: Widening 6 lanes to 8 is the cost for 6 lanes plus the incremental difference of a 6 lane widening and a 4 lane widening)

MOT = Per Mile Cost \* 10%; Mobilization = (MOT + Per Mile Unit Cost) \* 10%; Subtotal = Per Mile Unit Cost + MOT + Mobilization; Scope Contingency = Subtotal \* 25%; Long Range Planning Contingency = Subtotal \* 25%; CEI = Subtotal + Scope Contingency \* 15%; Total Cost = Subtotal + Scope Contingency + Long Range Planning Contingency + CEI

### **NOTES**

- 1. Multimodal Center construction cost based on Durham Station Multimodal in Durham, NC construction in 2009 at a cost of \$10 million with a 3% cost inflation factor
- 2. Parking garage and pedestrian overpass construction cost based on Pinellas Alternatives Analysis (AA) completed in 2013
  - Parking garage assumes \$15,000 per EACH SPACE with a 1% cost inflation factor
  - Pedestrian overpass assumes \$7,000 per LF with a 1% cost inflation factor

|---|-------------------------------------|----------|----------|----------|------------|------------------|
| Project                                   | Service Pattern                     | Vehicles | Vehicles |          |            | Costs (FY 14 \$) |
| Busch Boulevard/Linebaugh Avenue Corridor | 15th Street to Pinellas County Line | 6        | 8        | 352,060  | 13,680     | \$ 6,892,565     |
| North Rail Corridor                       | Fowler Avenue to Pasco County Line  | 2        | 3        | 216,690  | 6,210      | \$ 3,128,862     |

<sup>\*</sup> Capital costs for track were estimated on a cost per mile basis according to the following national examples:

<sup>\*</sup> Track costs assume the use of existing track which does not require the purchase of additional ROW

<sup>\*</sup> Capital costs for stations were estimated based on cost information from the Pinelllas Alternatives Analysis
